

1. What are fossil fuels? Why should we reduce their consumption?

- Fossil fuels include coal, petroleum and natural gas.
- These are called fossil fuels because like fossils they are the remains of plants and animals that lived long ago.
- They should be conserved as they are non-renewable sources of energy.
- Their overuse can pollute the environment.

2. Why is it important to conserve our mineral resources?

- Our mineral resources are limited and exhaustible.
  - Mineral fuels like coal, petroleum and natural gas take millions of years to form.
  - We are using these resources at a faster pace. If we continue to do so, the mineral deposits in the world will get exhausted.
  - We should use them carefully without wastage.
-
