As the both \(3 u \mathrm{~F}\) capacitors are connected in parallel, so net capacitance between branch \(\mathrm{EH}=3+3=6 \mu \mathrm{~F}\) Similarly, capacitance 2 uF and 1 uF at the corner B are also connected in parallel, so the net capacitance of branch FG \(=2+1=3 \mu \mathrm{~F}\) \\
If reconstruct the given figure according to the above calculations, we can see that \(6 \mu \mathrm{~F}\) capacitor and \(3 \mu \mathrm{~F}\) capacitor are connected in series and another 2 uF capacitor is connected in parallel with both of them. \\
Hence net capacitance Between D and C \(=2+3 \times 63+6=2+2=4 \mu \mathrm{~F}\) \\
The total capacitance of the circuit, Cnet \(=4 \mu \mathrm{~F}\) \\
Total voltage applied, \(V=100 \mathrm{~V}\) \\
Energy stored in the network \(=12\) CnetV2 \(=12 \times 4 \times 10-6 \times(100) 2=0.02 \mathrm{~J}\)
