\hline 19 \& | b) i) The soft iron coil in a galvanometer will make the field radial. Also, it increases the strength of the magnetic field. |
| :--- |
| ii) Current sensitivity in the galvanometer is given by, $\frac{\theta}{1}=\frac{\text { NBA }}{k}$ Voltage sensitivity in the galvanometer is given by, $\frac{\theta}{V}=\frac{\theta}{\mathbb{R}}=\left(\frac{n B A}{k}\right) \cdot \frac{1}{R}$ |
| The above two equations imply that increasing the current sensitivity may not necessarily increase the voltage sensitivity. | \& 1

\hline 20. \& | a) When screen is moved away, $D$ increases. As $\beta=\lambda D / d$ therefore width of the fringes increases. |
| :--- |
| (b) If $s$ is size of the source and $S$ is distant of source from the plane of the two slits, then for interference fringes to seen, the condition is $s / S<\lambda / D$ |
| As source slit is brought closer to double slit plane, S decreases, the interference pattern gets less and less sharp. When the source is too close, the fringe separation remains fixed. | \& 1
